

The Supernova Remnant View of SN Ia Progenitors

Carles Badenes
University of Pittsburgh

FOE 2015, NCSU
June 4, 2015

with **H. Yamaguchi** (NASA/UMd), **E. Bravo** (UPC), **D. Patnaude** (CfA), **S. Park** (UTA), **P. Slane** (CfA), **B. Williams** (NASA), and others

**SN Ia progenitors
remain unidentified**

**Supernova Remnants
(SNRs) \Rightarrow different
perspective on SNe**

SNRs remember their
birth events.

- **SN-CSM Interaction:**
progenitor stellar
evolution.
- **n-rich Fe-peak
elements:** progenitor
mass.

Single vs. Double Degenerate SN Ia

Carles Badenes
FOE 04/06/15

Single Degenerate (SD): WD+non-degenerate star.

- Slow accretion \Rightarrow mass growth \Rightarrow **explosion near M_{ch}** [Hachisu+ 96].
- **Some CSM** expected (accretion cannot be 100% efficient) [Han & Podsiadlowski 04].

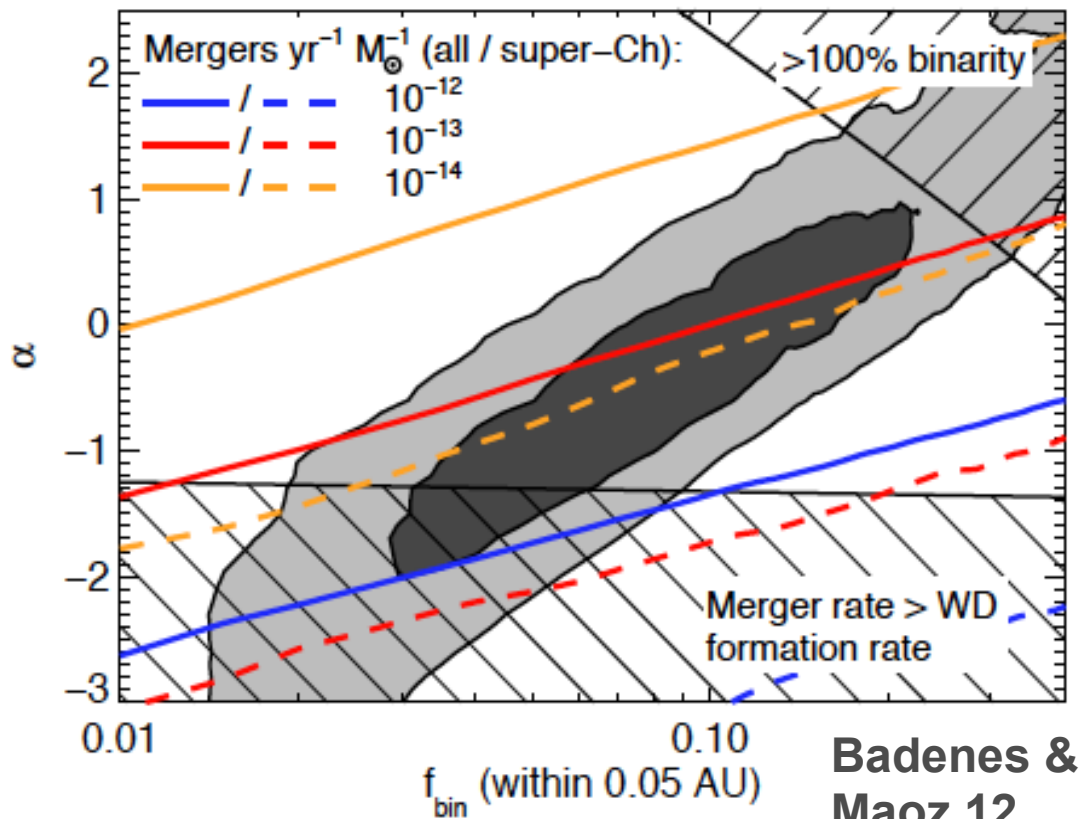

Double Degenerate (DD): WD+WD.

- GW emission \Rightarrow merging/collision \Rightarrow **explosion not necessarily near M_{ch}** [Iben & Tutukov 84, Webbink 84, Sim+ 10, van Kerkwijk+ 10].
- **Not much CSM** expected (WDs are evolved objects).

FOE 2013: DD vs. SD debate. I argued that most SN Ia were DD. WD+WD merger rate in the Milky Way ~ SN Ia rate in Sbc spirals

[Badenes & Maoz 12].

CSM Interaction in Type Ia SNRs

CSM Interaction in SN Ia

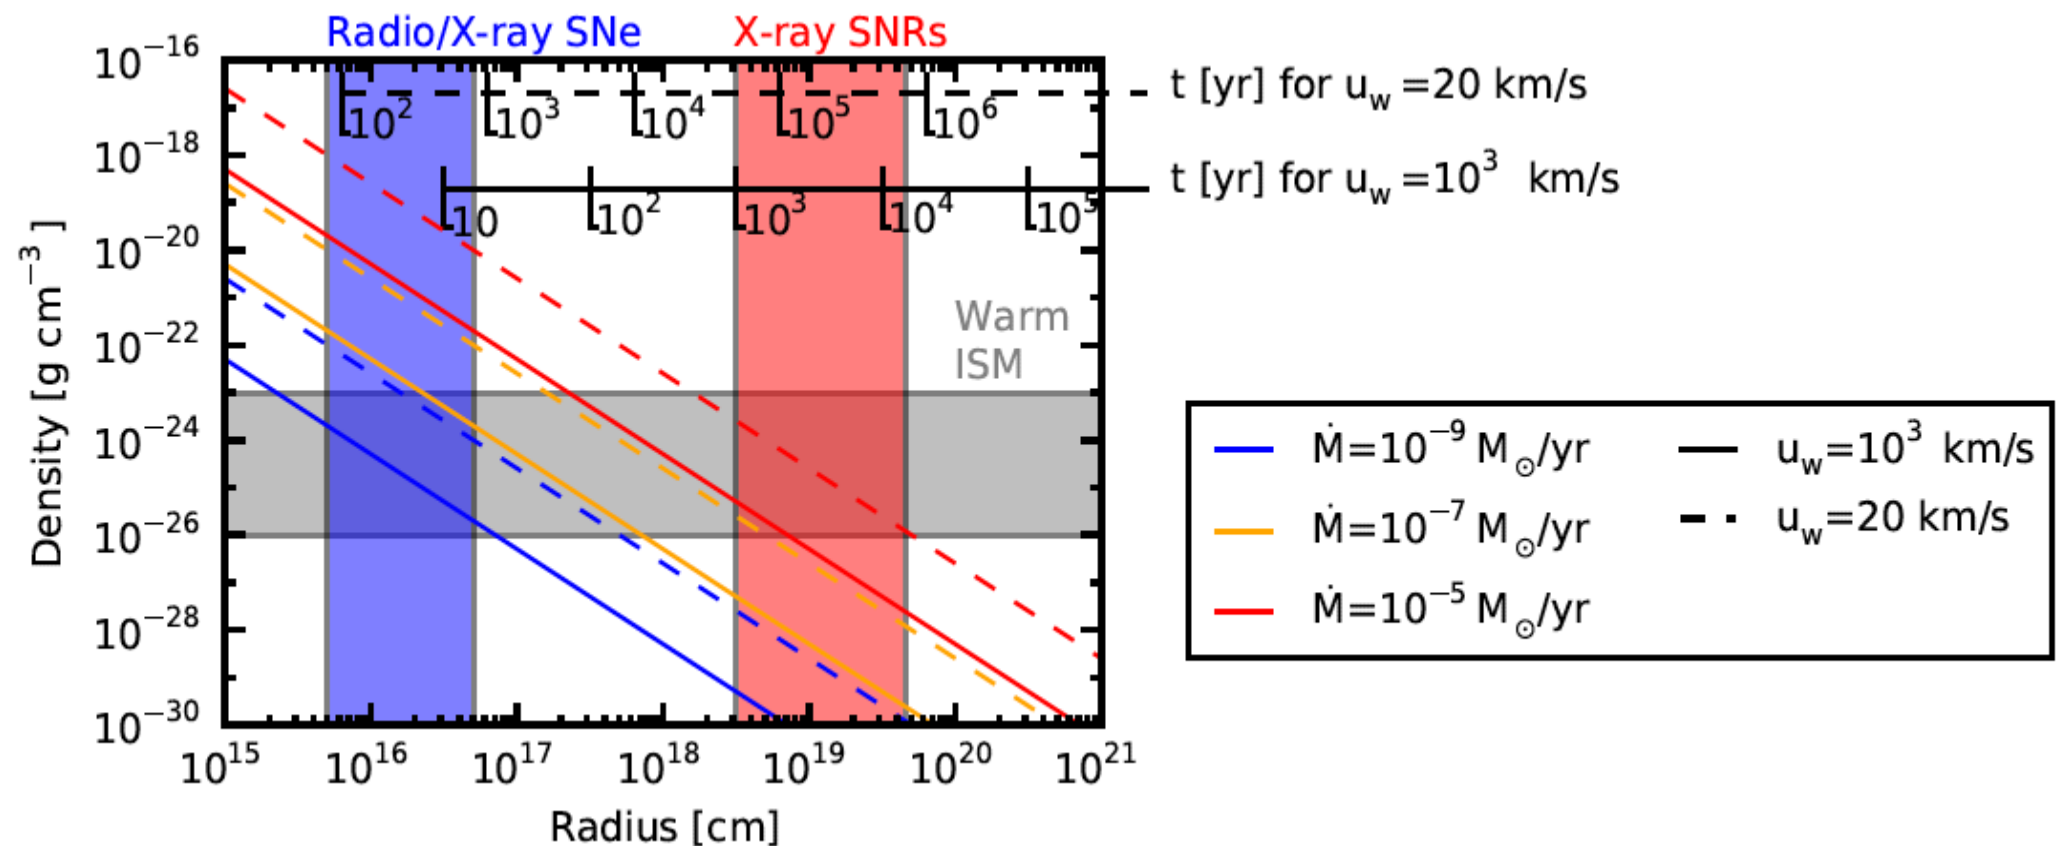

Carles Badenes
FOE 04/06/15

Most SN Ia show **no signs of dynamical interaction with CSM** \Rightarrow small dM/dt from progenitor.

- **Early times (~ 1 d):** no extended envelope or accretion disk in optical light curves [Hayden+ 10; Bianco+ 11].
- **Intermediate times (~ 10 d):** no radio or X-ray detections $\Rightarrow (dM/dt)/v < 10^{-9} M_{\odot} \text{ yr}^{-1} (100 \text{ km s}^{-1})^{-1}$ [Chomiuk+ 12, Margutti+ 12, Perez-Torres+ 14].
- **Late times (~ 500 yr):** (Most) Type Ia SNRs consistent with a uniform ISM [Badenes+ 06, 07, 08a].

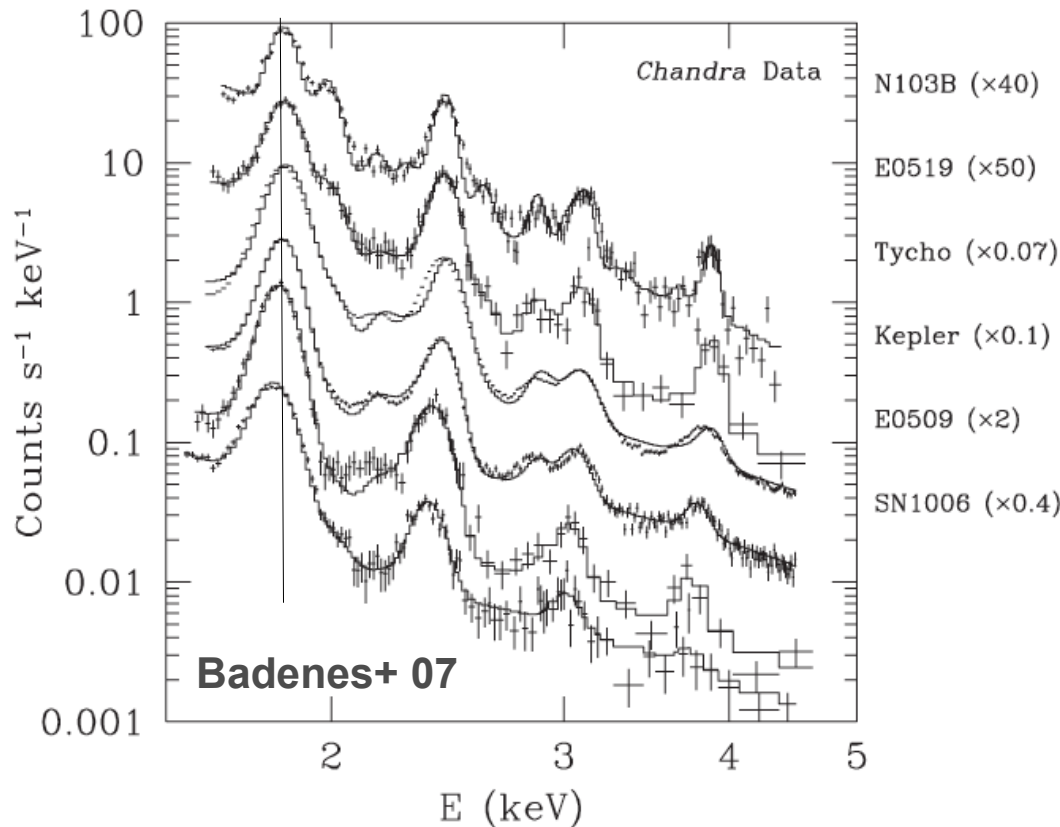

- **SNRs \Rightarrow spatial (and temporal) scales relevant for stellar evolution** of SN progenitors ($t \lesssim \tau_{\text{KH}}$).
- **Can only probe dynamical interaction:** CSM that can slow down SN ejecta.

CSM Interaction in SNRs

Carles Badenes
FOE 04/06/15

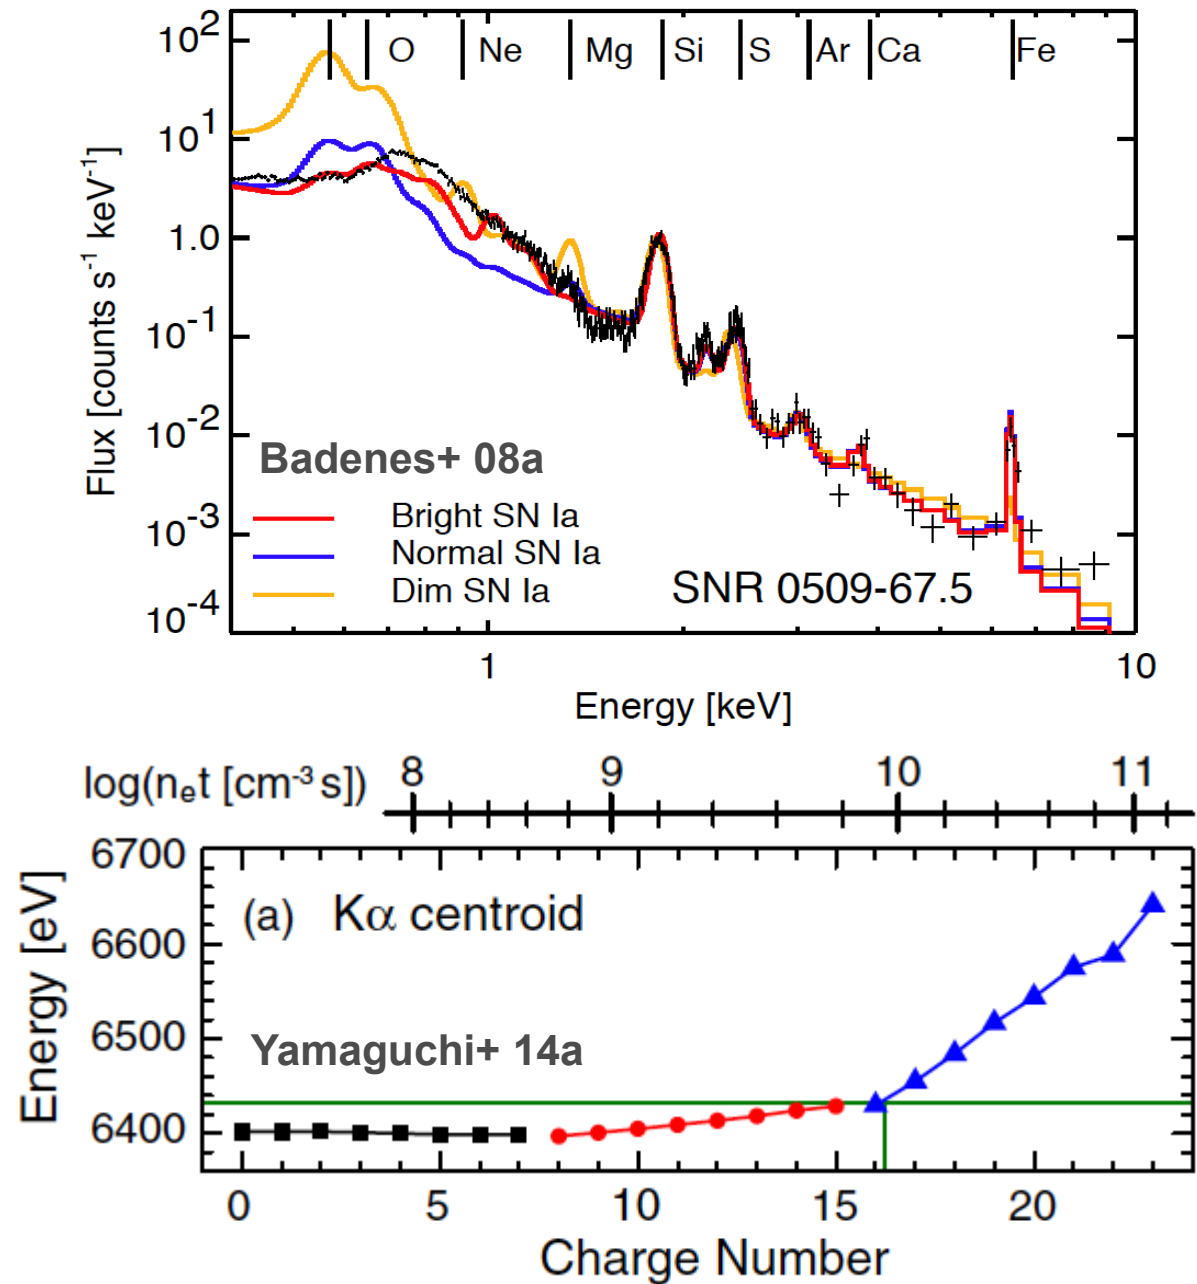

- **X-ray spectra \Rightarrow AM structure constraints.** NEI plasma: ionization timescale ($n_e t$) [Badenes+ 07].
- High $n_e t \Rightarrow$ high centroid energy and line flux.

CSM Interaction in SNRs: Fe K

Carles Badenes
FOE 04/06/15

- Use **Fe K α line blend** at ~ 6.5 keV as an integrated AM density diagnostic.
- Most SNe (Ia and CC) eject some Fe \Rightarrow innermost layers.
- Large $n_e t$ required to fully ionize Fe \Rightarrow **large dynamic range in ρ_{AM}** .
- Need high effective area at 6.5 keV: **Suzaku**.
- Details: Yamaguchi, CB+ 14b

Fe K Emission in SNRs

Carles Badenes
FOE 04/06/15

- **24 SNRs** (22 *Suzaku*, +1 *Chandra* [Borkowski+ 13], +1 *XMM* [Maggi+ in prep.]).
- Scatter plot?

Fe K Emission in SNRs

Carles Badenes
FOE 04/06/15

- **24 SNRs** (22 *Suzaku*, +1 *Chandra* [Borkowski+ 13], +1 *XMM* [Maggi+ in prep.]).
- Account for dynamically old/young SNRs \Rightarrow **bimodal distribution** in FeK centroid/luminosity.

Fe K Emission in SNRs

Carles Badenes
FOE 04/06/15

- **24 SNRs** (22 *Suzaku*, +1 *Chandra* [Borkowski+ 13], +1 *XMM* [Maggi+ in prep.]).
- Account for dynamically old/young SNRs \Rightarrow **bimodal distribution** in FeK centroid/luminosity.
- **Ia/CC SNRs \Leftrightarrow low/high FeK centroids.**

Fe K Emission in SNRs

Carles Badenes
FOE 04/06/15

- **24 SNRs** (22 *Suzaku*, +1 *Chandra* [Borkowski+ 13], +1 *XMM* [Maggi+ in prep.]).
- Account for dynamically old/young SNRs \Rightarrow **bimodal distribution** in FeK centroid/luminosity.
- **Ia/CC SNRs \Leftrightarrow low/high FeK centroids.**
- **CSM interaction!**
- New method to classify SNRs + quantify CSM interaction.

Type Ia SNR Models

Carles Badenes
FOE 04/06/15

- **Type Ia SNR**

models: M_{Ch} ejecta + uniform AM evolved to 5000 yr [Badenes+03,05,06,08a].

- **DDT** ejecta models (dim, normal, bright SN Ia) \Rightarrow crude (but effective) **diagnostic of SN Ia brightness!**

- Also **PDD** models \Rightarrow more compact ejecta.

- **Uniform AM, M_{ch} ejecta can explain (most) Ia SNRs.**
- N103B requires PDD model, maybe CSM interaction [Williams+ 14].
- **Evaluate stellar evolution + explosion with SNR observations.**
- **Models are required to interpret these data.**

What is going on?

Carles Badenes
FOE 04/06/15

- **Different dynamics for CC and Ia SNRs:** several M_{\odot} of CSM vs. much less, maybe none \Rightarrow later transition to Sedov.
- **Kepler, N103B might have some CSM** [Patnaude+ 12, Burkey+ 12, Chiotellis+ 12, Williams+ 14].
- **RCW 86** (and possibly G344.7-0.1) are **cavity explosions** [Badenes+ 07, Williams+ 11, Broersen+ 14].

RCW 86 requires a fast, sustained outflow from the SN progenitor

- **SN Ia AM density estimates** from radio/X-ray SNe (~ 10 d, ~ 0.01 pc) and SNRs (~ 500 yr, \sim several pc) **are consistent with the warm phase of the ISM** [Chomiuk+12 Perez-Torres+ 14, Raymond+ 07, Slane+ 14, Borkowski+ 14]. Mild CSM interaction is allowed, probably also small (~ 0.5 pc) cavities around the progenitor.

Steps Forward

Carles Badenes
FOE 04/06/15

- **Expand the model grid for Type Ia SNRs:** CSM interaction, sub-Chandra explosions (Matt Schell's thesis).
- **Improve the model physics:** CR-modified dynamics [Lee+ 14].
- **CC SNR models.** Evaluate SN and progenitor models at the same time [Patnaude+15].
- ***Astro-H*** scheduled for launch in 2016 \Rightarrow Revolution in X-ray observations of SNRs.

Steps Forward

Carles Badenes
FOE 04/06/15

- **Expand the model grid for Type Ia SNRs:** CSM interaction, sub-Chandra explosions (Matt Schell's thesis).
- **Improve the model physics:** CR-modified dynamics [Lee+ 14].
- **CC SNR models.** Evaluate SN and progenitor models at the same time [Patnaude+15].
- **Astro-H** scheduled for launch in 2016 \Rightarrow Revolution in X-ray observations of SNRs.

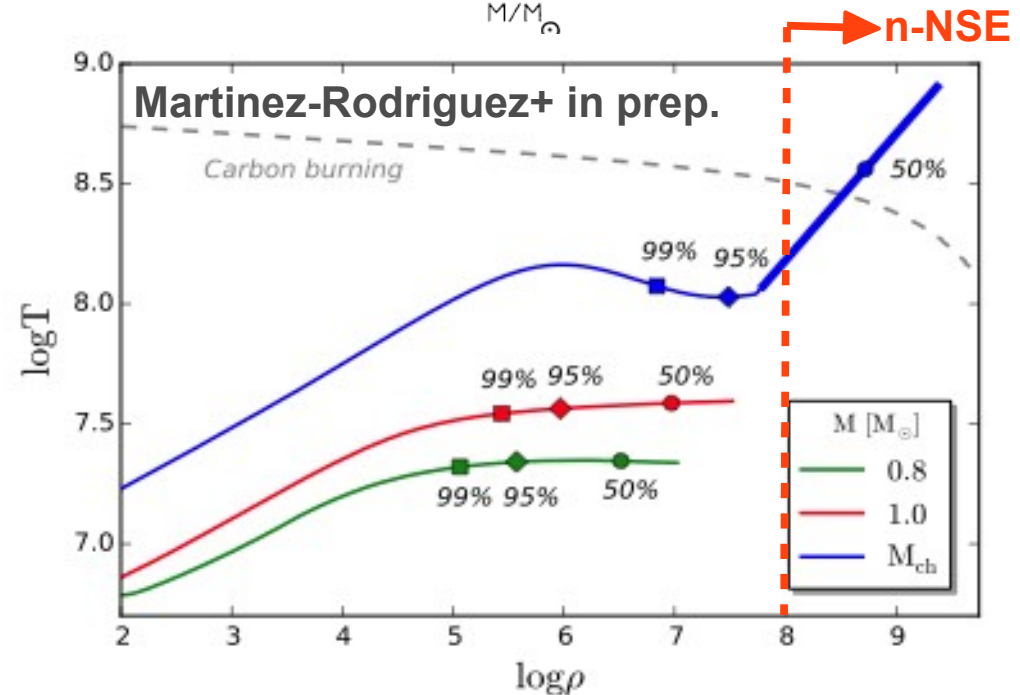

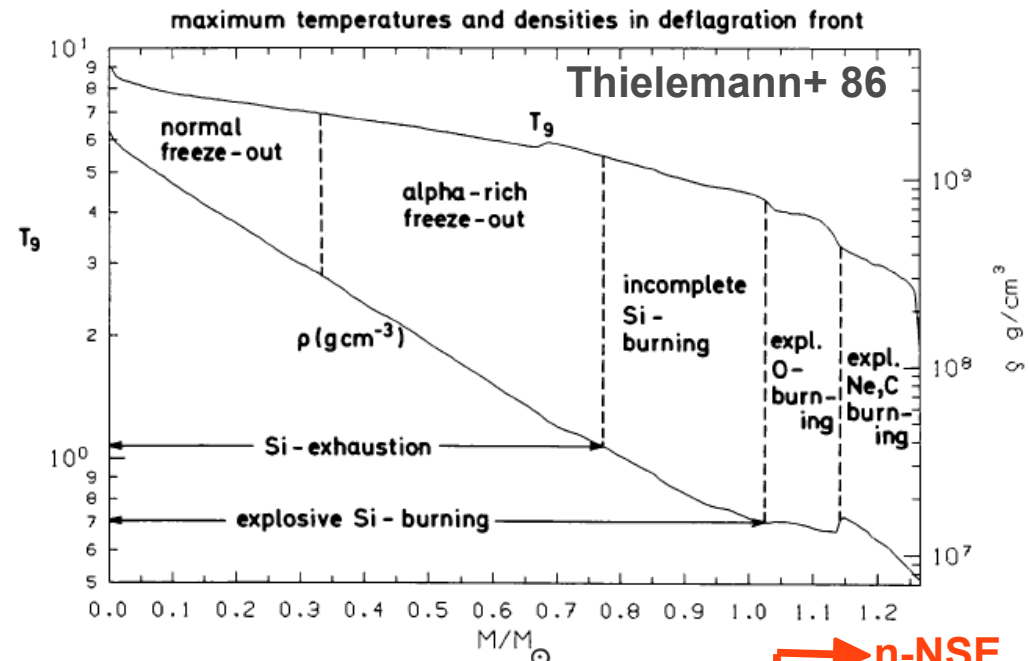

Secondary Fe-peak Elements in Type Ia SNRs

SN Ia Nucleosynthesis 101

Carles Badenes
FOE 04/06/15

- **Burning regimes in SN Ia:** Exp. O burning, exp. Si burning, NSE, n-NSE \Rightarrow Si, S, Ar, Ca, Fe [Thielemann+ 86, Seitenzahl talk].
- **What about n-rich isotopes (^{55}Mn , ^{60}Ni , ...)?** CO WDs have no neutron excess! Whence n?
- **Progenitor metallicity.** CNO bottleneck is $^{14}\text{N}(\alpha, \gamma) \Rightarrow ^{22}\text{Ne} \Rightarrow$ n-excess = $0.1 \times Z$ [Timmes+ 03, Badenes+ 08].
- **n-NSE** (NSE at high densities). **Requires $M_{\text{WD}} \sim M_{\text{Ch}}$!!**
- **C-simmering.** This is complicated [Piro & Bildsten 08].

Secondary Fe-peak Elements

Carles Badenes
FOE 04/06/15

- **M_{ch} DDT explosions** (standard SN Ia models) [Khokhlov 91]. One parameter (ρ_{tr}) \Rightarrow ^{56}Ni yield (SN Ia brightness).
- **Sub-Ch explosions** also viable [Sim+ 10]. One parameter (M_{WD}) \Rightarrow ^{56}Ni yield.
- **Sub-Ch models do not reach n-NSE \Rightarrow smaller yield of neutronized species (Mn, Ni).**
- **Tentative association:**
 - **M_{ch} DDT \Leftrightarrow SD**
 - **Sub-Ch \Leftrightarrow DD**

Secondary Fe-peak Elements

Carles Badenes
FOE 04/06/15

- **M_{ch} DDT explosions** (standard SN Ia models) [Khokhlov 91]. One parameter (ρ_{tr}) \Rightarrow ^{56}Ni yield (SN Ia brightness).
- **Sub-Ch explosions** also viable [Sim+ 10]. One parameter (M_{WD}) \Rightarrow ^{56}Ni yield.

- **Tentative association:**
 - **M_{ch} DDT \Leftrightarrow SD**
 - **Sub-Ch \Leftrightarrow DD**

Secondary Fe-peak Elements

Carles Badenes
FOE 04/06/15

- Yield of neutronized species: **n-NSE + progenitor metallicity**
[Timmes+ 03, Badenes+ 08b].
- Diagnostic mass ratios: $M_{\text{Ni}}/M_{\text{Fe}}$ and $M_{\text{Mn}}/M_{\text{Fe}} \Rightarrow$ discriminate Ch and Sub-Ch explosions!
- Mn and Ni are hard to observe in the optical
[Maeda+ 10, Seitenzahl+ 13].

Secondary Fe-peak Elements

Carles Badenes
FOE 04/06/15

- Yield of neutronized species: **n-NSE + progenitor metallicity**
[Timmes+ 03, Badenes+ 08b].

- Diagnostic mass ratios: $M_{\text{Ni}}/M_{\text{Fe}}$ and $M_{\text{Mn}}/M_{\text{Fe}} \Rightarrow$ discriminate Ch and Sub-Ch explosions!

- Mn and Ni are hard to observe in the optical
[Maeda+ 10, Seitenzahl+ 13].

M_{Ch} DDT	ρ_{DDT} [g cm^{-3}]	Sub- M_{Ch}	M_{WD} [M_{\odot}]
●	3.9×10^7	●	1.15
■	2.6×10^7	■	1.06
▲	1.3×10^7	▲	0.97
★	1.0×10^7	★	0.88

Secondary Fe-peak Elements

Carles Badenes
FOE 04/06/15

- **Suzaku** can detect Cr, Mn, and Ni lines in SNRs: Tycho, Kepler, ... [Tamagawa+ 08, Park+ 13, Yang+ 13].
- In young objects, **RS has not reached n-NSE** region \Rightarrow progenitor metallicity [Badenes+ 08b, Park+ 13].

Secondary Fe-peak Elements

Carles Badenes
FOE 04/06/15

- **Suzaku** can detect Cr, Mn, and Ni lines in SNRs: Tycho, Kepler, ... [Tamagawa+ 08, Park+ 13, Yang+ 13].

- In young objects, **RS has not reached n-NSE** region \Rightarrow progenitor metallicity [Badenes+ 08b, Park+ 13].

- Need an **evolved SNR with lots of Fe** \Rightarrow **SNR 3C397!**

SNR 3C397

Carles Badenes
FOE 04/06/15

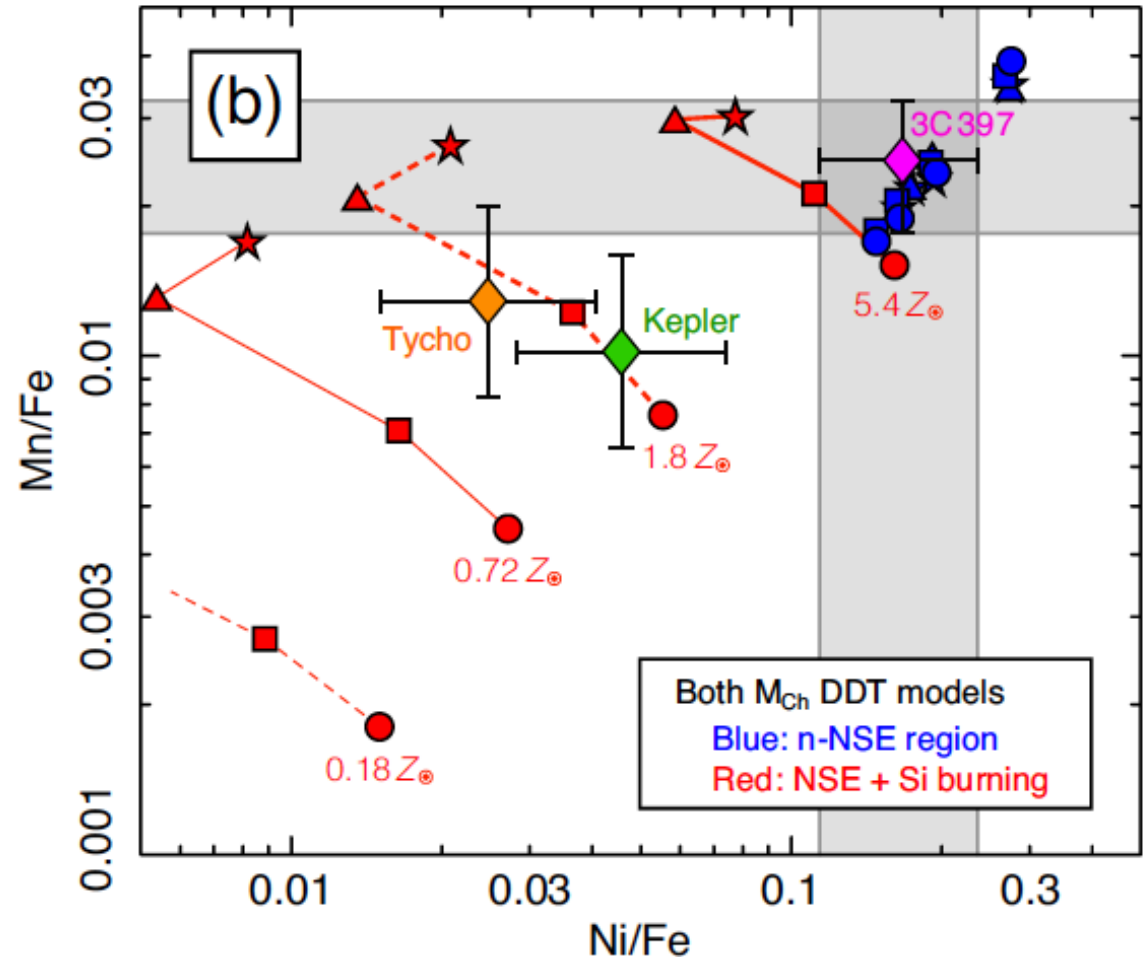

- 3C397 is an evolved Type Ia SNR at $D \sim 10$ kpc [Safi-Harb+ 05].
- Consistent dynamical model (IR+X-ray) \Rightarrow **RS has thermalized all the SN ejecta.**
- Extraordinary X-ray spectrum! **Very strong Ni and Mn emission.**

- Model line emission with updated atomic data (AtomDB, Foster+) \Rightarrow
 $M_{\text{Ni}}/M_{\text{Fe}} \sim 0.2$; $M_{\text{Mn}}/M_{\text{Fe}} \sim 0.03$.
- **Sub-Ch models do not work**, or require unreasonable progenitor metallicities ($>5Z_{\odot}$).
- $M_{\text{Ni}}/M_{\text{Fe}}$ and $M_{\text{Mn}}/M_{\text{Fe}}$ **require n-NSE material** \Rightarrow **Chandrasekhar-mass progenitor**.
- Details: Yamaguchi, CB + 15 [arXiv:1502:04255]

- Model line emission with updated atomic data (AtomDB, Foster+) \Rightarrow
 $M_{\text{Ni}}/M_{\text{Fe}} \sim 0.2$; $M_{\text{Mn}}/M_{\text{Fe}} \sim 0.03$.
- **Sub-Ch models do not work**, or require unreasonable progenitor metallicities ($>5Z_{\odot}$).
- $M_{\text{Ni}}/M_{\text{Fe}}$ and $M_{\text{Mn}}/M_{\text{Fe}}$ **require n-NSE material** \Rightarrow **Chandrasekhar-mass progenitor**.
- Details: Yamaguchi, CB + 15 ApJ 801, L31

SNR 3C397

Carles Badenes
FOE 04/06/15

- Could the progenitor of SNR 3C397 be a VERY metal-rich sub-Ch WD? Extremely unlikely.
- **Evidence for some M_{ch} SN Ia progenitors is now growing** [Seitenzahl+ 13, Scalzo+ 14].

A CHANDRASEKHAR MASS PROGENITOR FOR THE TYPE Ia SUPERNOVA REMNANT 3C 397 FROM THE ENHANCED ABUNDANCES OF NICKEL AND MANGANESE

HIROYA YAMAGUCHI^{1,2,3}, CARLES BADENES⁴, ADAM R. FOSTER³, EDUARDO BRAVO⁵, BRIAN J. WILLIAMS¹, KEIICHI MAEDA^{6,7},
MASAYOSHI NOBUKAWA⁸, KRISTOFFER A. ERIKSEN⁹, NANCY S. BRICKHOUSE³, ROBERT PETRE¹, AND KATSUJI KOYAMA^{8,10}

**SN Ia in star-forming galaxies probably come
from a mixture of SD and DD progenitors**

- **Fe K line** \Rightarrow **CC/Ia SNRs + quantitative test for progenitor evolution scenarios (CSM).**
- **Dynamically, most Ia SNRs are compatible with little or no CSM.** $\sim M_{\text{ch}}$, uniform AM models work really well \Rightarrow **DD?**
- **RCW 86** (and maybe G344.7-0.1) **require fast, continuous pre-SN outflows** \Rightarrow **SD?**
- **SNR 3C397 shows prominent Mn and Ni emission** $\Rightarrow M_{\text{ch}}$ **progenitor** \Rightarrow **SD.**
- **Other measurements show a preference for DD** scenario (no companions, DTD, merger rate).

SN Ia in star-forming galaxies probably come from a mixture of SD and DD progenitors

Type Ia SNRs and cavities

Carles Badenes
FOE 04/06/15

- **Radii and $n_e t$ of Type Ia SNRs** with known ages are **consistent with uniform ambient medium interaction** [Badenes+ 07].
- **'Accretion winds'** in SD progenitor models [Hachisu+ 96] excavate **large cavities** [Koo & McKee 92] that lead to **large SNR radii and low $n_e t$** .

- **RCW 86** is large (~ 25 pc), with well defined borders, low $n_e t$, bright Fe, and no compact remnant [Williams+ 11].
- **IF SNR of SN 185 AD \Rightarrow cavity explosion** [Vink+ 97].
- **IF Ia SNR \Rightarrow fast, sustained outflow** from the progenitor \Rightarrow **SD** [Badenes+ 07, Williams +11].
- A light echo or detailed HD+NEI models would be very nice!

Other cavity Ia SNRs?

Carles Badenes
FOE 04/06/15

- **RCW 86** might not be the only example of Type Ia SN in a cavity.
- **DEM L238** and **DEM L249**, two middle-aged SNRs in the LMC have Fe-rich spectra and low $n_e t$.
- **IF Type Ia SNRs**, they might also be **cavity explosions** [Borkowski+ 06].
- **Beware:** typing SNRs older than a few thousand years is difficult, and so is modeling their dynamic evolution!

Borkowski+ 06

CSM in CC SNRs

Carles Badenes
FOE 04/06/15

- In more evolved SNRs like **G292.0+1.8**, forward shock morphology can constrain ejecta and CSM density profiles \Rightarrow CC SN progenitor [Lee+ 10].

CSM Interaction: Kepler SNR

- **Kepler is unique among Type Ia SNRs** in that it shows **clear signs of a non-uniform AM** in the NW: brighter X-ray emission, larger $n_e t$, lower expansion parameters, optical N-rich emission [Blair+ 91, Reynolds+ 07, Vink 08].
- Well above Galactic plane \Rightarrow **CSM from a mass-losing progenitor**. A popular model posits a large relative motion wrt to the local ISM \Rightarrow **bow shock structure overrun by SN ejecta** [Bandiera 87, Borkowski+ 92, 94].

CSM Interaction: Kepler SNR

- Morphology (radius and N/S asymmetry) and kinematics (expansion parameters) can be reproduced by a **sybiotic model** (AGB wind ~ 20 km/s, moving at 250 km/s wrt ISM) [Chiotellis+ 12].

- However, this requires a **subenergetic** SN explosion ($E \sim 2 \times 10^{50}$ erg).

Fig. 4. The evolution of the wind bubble of model A. The snapshots from left to right correspond to the times 0.10 Myr, 0.29 Myr, 0.38 Myr and 0.57 Myr.

Chiotellis+ 12

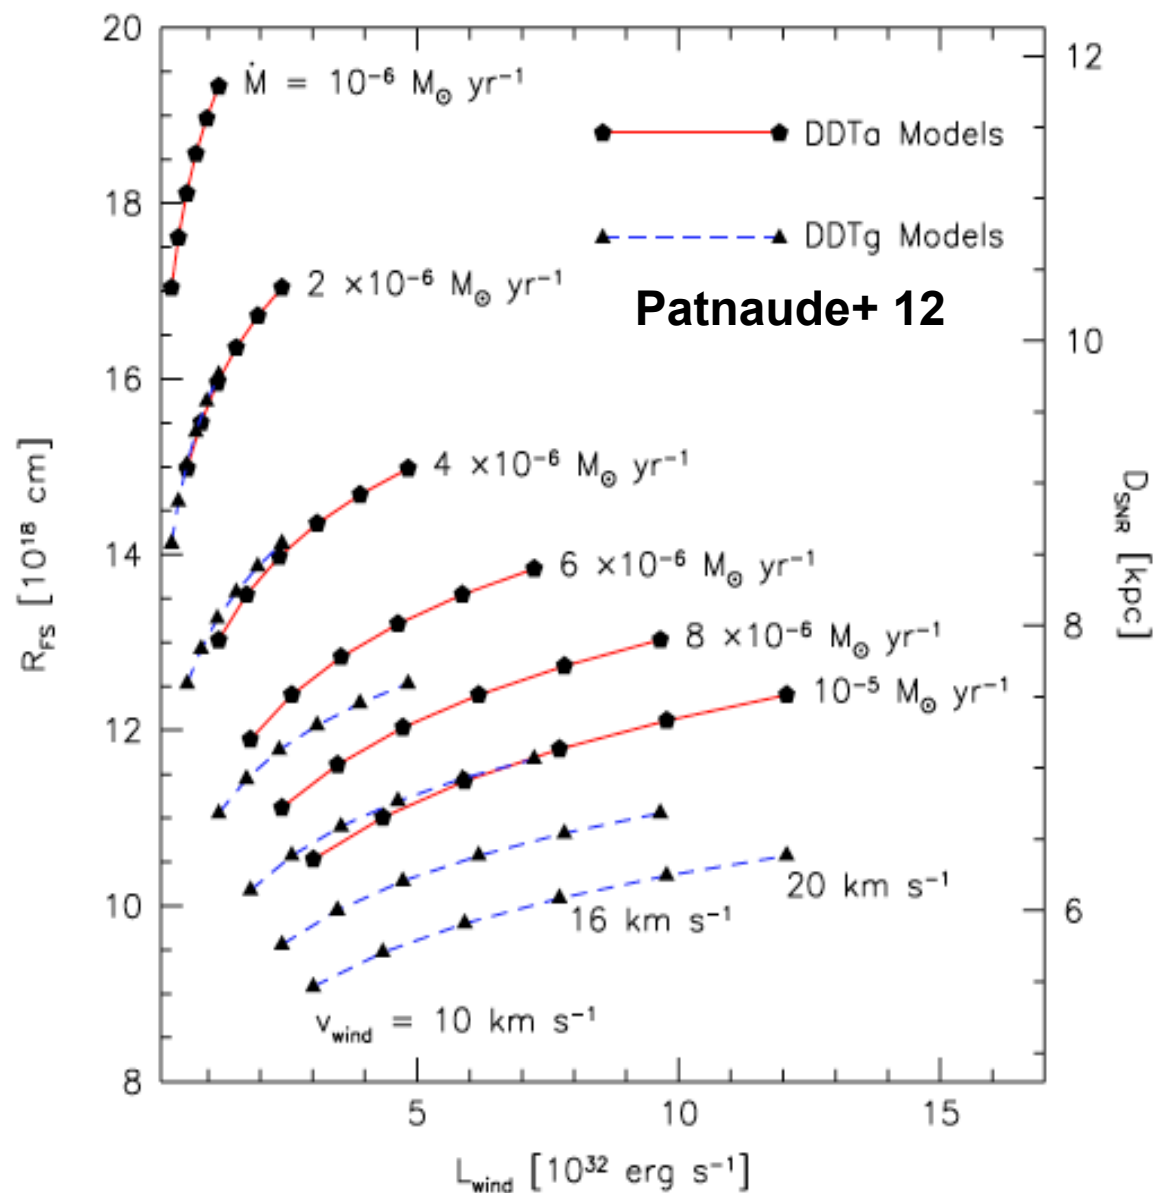

Fig. 5. SNR evolution of model A. The snapshots from left to right correspond to the times 158 yr, 285 yr, 349 yr and 412 yr.

CSM Interaction: Kepler SNR

- HD+NEI models in the S, where the ejecta should be interacting with the pristine CSM from the progenitor \Rightarrow **constrain both $M_{56\text{Ni}}$ and pre-SN dM/dt** [Patnaude+ 12].

CSM Interaction: Kepler SNR

- HD+NEI models **rule out a standard $\rho \propto r^{-2}$ CSM!** (allowed by HD [Chiotellis+ 12]).
- **Small cavity + wind** works [Wood-Vasey & Sokoloski 06], but so does a **uniform AM.**
- In any case, Kepler must have been a bright SN Ia ($M_{56\text{Ni}} \sim 1 M_{\odot}$).

Patnaude+ 12
